How many treatments will I need?

The treatment schedule and number of sessions may vary depending on the severity of the condition to be treated. Your physician will recommend a treatment course that is right for your condition. Typically Gold Toning treatment is performed on a weekly or biweekly basis for less than five sessions unless the condition is unusually severe.

How soon will my post-acne redness improve?

Your post-acne redness will lighten two to three times faster than if left alone. However, the treatment effect may be faster or delayed depending on the severity of your condition or depending on the synergic effect of combination treatments.

Is Spectra Gold Toning more effective than acne drugs?

Your physician will recommend the best course of treatment for your acne. Typically acne drugs have associated side effects, such as dry skin, depression, joint pain and more. However, Gold Toning is a skin treatment which doesn't affect the body systemically, so it is a good alternative especially for those who cannot tolerate the drugs.

Do I still need other combination treatments?

It will depend on your condition; your physician may combine any type of treatment for better clinical effects.

WHAT TO EXPECT WITH GOLD TONING?

SIMPLE TREATMENT PROVIDES EXCELLENT RESULTS

With Gold Toning you can expect to improve;

- Post-acne Redness
- Inflammatory Acne
- Facial Flushing
- Post-laser Flushing

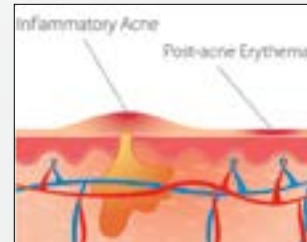

When acne subsides naturally or after any type of treatment, your skin can remain reddish, which can persist for a certain period of time.

When treated with the Gold Toning laser beam, the laser energy is absorbed by hemoglobin in the dilated microvasculature which is responsible for causing the appearance of redness. Gold Toning plays a significant role in reducing the appearance of the abnormal

microvasculature, allowing the skin color to return back to normal.

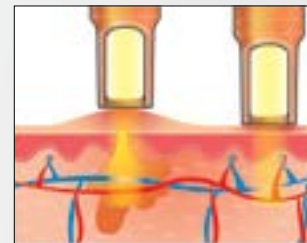

Gold Toning not only improves post-ance redness, but it also helps to subdue inflamed acne even without taking acne drugs. Over time Gold Toning becomes the solution for post-acne redness to inflammatory acne.

STEP 1

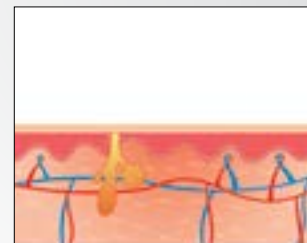

inflammatory acne is in the active phase, and post-acne erythema can persist, causing the skin to appear flushed, even after the actual acne goes away.

STEP 2

Visible yellow laser energy is delivered to the inflammatory acne and post-acne erythema area, and is absorbed by hemoglobin in the dilated microvasculature. The appearance of the vasculature is reduced in size over a period of treatments.

STEP 3

The inflammatory acne subsides and the areas of post-acne erythema lighten back to the color of the surrounding normal skin.
